32-2415: GSTO2 Recombinant Protein

Alternative Name :	Glutathione S-transferase omega-2,GSTO-2,Glutathione S-transferase omega 2-2,GSTO 2-2,Glutathione-dependent dehydroascorbate reductase,Monomethylarsonic acid reductase,MMA(V) reductase,GSTO2,bA127L20.1.

Description

Source : Escherichia Coli. GSTO2 Human Recombinant produced in E.coli is a single, non-glycosylated polypeptide chain containing 266 amino acids (1-243) and having a molecular mass of 30.6kDa.GSTO2 is fused to a 23 amino acid His-tag at N-terminus & purified by proprietary chromatographic techniques. Glutathione S-transferase omega 2 (GSTO2) is a member of the GST superfamily. GSTO2 is involved in catalyzing the reaction of glutathione with a broad range of organic compounds to form thioethers, a process which is vital for the metabolism and detoxification of a variety of xenobiotics and carcinogens. GSTO2 displays glutathione-dependent thiol transferase activity. GSTO2 has a high dehydroascorbate reductase activity and may be a factor in the recycling of ascorbic acid. GSTO2 also participates in the biotransformation of inorganic arsenic and reduces monomethylarsonic acid (MMA). GSTO2 is expressed in an array of tissues, including the liver, kidney, skeletal muscle and prostate, while the strongest expression is seen in the testis.
