30-1382: Anti-GABA B receptor GB1a subunit Polyclonal Antibody(Discontinued)

Clonality: Polyclonal
Application: WB
Reactivity: Mouse
Format: Purified
Isotype: Rabbit IgG

Immunogen Information: Synthetic peptide (coupled with THG) derived from aminoacid sequence 100-124 of mouse GABA

B receptor 1. The sequence has 100% homology with rat and human.

Description

GABA B receptor is a G-protein-coupled inhibitory receptor of gamma-aminobutyric acid (GABA), and has important functions in brain by inhibition of adenylyl cyclase and modulation of G-protein-gated Ca2+ and K+ channels. GABA B receptor is comprised of two subunits, GB1 and GB2 with N-terminal extracellular and C-terminal intracellular domains. The GB1 subunit plays a critical role in ligand binding, whereas the GB2 subunit contains the determinants required for G-protein signaling. Multiple allosteric interactions between the two subunits are required for correct functioning of the receptor. There are two N-terminal splice variants of GB1 subunit, termed GB1a and GB1b; their expression in the central nervous system changes during the ontogenesis and differs between various regions of the brain.

Product Info

Amount: 0.1 mg

Purification: Purified from rabbit serum by precipitation methods

Storage condition : Store at 2-8°C. Do not freeze.
