Description

Source: HEK293 Cells.

Sterile Filtered colorless solution.

Hyaluronidase-1 or HYAL1 is a protein, part of the endolytic glycoside hydrolase proteins group. Human hyaluronidases proteins, are 5 endo- β -acetylhexosaminidases (including HYAL1, HYAL2, HYAL3). Hyaluronidase-1 causes degradation to hyaluronic acid in the extracellular matrix of somatic tissues. HYAL1 needs an acidic environment and is the most common hyaluronidase in the plasma. Mutations in this protein can lead to mucopolysaccharidosis type IX and hyaluronidase deficiency.

HYAL1 Human Recombinant produced in HEK cells is a single, glycosylated, polypeptide chain (22-435 a.a) containing a total of 420 amino acids, having a molecular mass of 46.9 kDa. HYAL1 is fused to a 6 amino acid His-tag at C-terminus, and is purified by proprietary chromatographic techniques.
