32-13061: C.Albicans Enolase

Description

Source: Sf9 insect cells.
Sterile Filtered clear solution.
Candida albicans is a diploid fungus, which grows both as yeast and filamentous cells and a contributory agent of opportunistic oral and genital infections in humans, and candidal onychomycosis (an infection of the nail plate). Systemic fungal infections (fungemias) including those by C. albicans are regarded as key causes of morbidity and mortality in immunocompromised patients (e.g., AIDS, cancer chemotherapy, organ or bone marrow transplantation). C. albicans biofilms may develop on the surface of implantable medical devices. C. albicans is commensal and a constituent of the normal gut flora containing microorganisms which live in the human mouth and gastrointestinal tract. Overgrowth of the fungus leads to in candidiasis (candidosis). Candidiasis is frequently detected in immunocompromised persons, including HIV-infected patients. To infect host tissue, the habitual unicellular yeast-like form of C. albicans reacts to environmental signals and changes into an invasive, multicellular filamentous form, a phenomenon which is known as dimorphism.
Recombinant Candida Albicans Enolase produced in SF9 is a glycosylated, polypeptide chain having a calculated molecular mass of 46kDa. C.Albicans Enolase is expressed with a 10xHis tag at N-terminus and purified by proprietary chromatographic techniques.

Product Info

Amount :	50 µg / 100 µg
Purification :	Greater than 95.0% as determined by SDS-PAGE.
Content :	C.Albicans Enolase is supplied in 20mM HEPES buffer pH-8, 200mM NaCl and 20% glycerol.
Storage condition :	Store at 4°C if entire vial will be used within 2-4 weeks. Store, frozen at -20°C for longer periods of time. Avoid multiple freeze-thaw cycles.

For Research Use Only. Not for use in diagnostic/therapeutics procedures.
