Description

Source: Sf9, Baculovirus cells.

Sterile Filtered colorless solution.

Cadherin-2 isoform 1, also known as CDH2 is a transmembrane, homophilic glycoprotein which belongs to the calcium-dependent cell adhesion molecule family. CDH2 takes part in neurons and later on was discovered to participate in cardiac muscle and in cancer metastasis as well. The CDH2 loss promotes tumorigenesis through releasing membrane-bound Beta-catenin, and so stimulating Wnt signaling. Furthermore, CDH2 appears to be implicated in tumor development, however this discovery is limited in adrenocortical tumors-ACTs.

CDH2 Human Recombinant produced in Sf9 Baculovirus cells is a single, glycosylated polypeptide chain containing 574 amino acids (160-724a.a.) and having a molecular mass of 62.9kDa (Molecular size on SDS-PAGE will appear at approximately 70-100kDa). CDH2 is expressed with a 6 amino acids His tag at C-Terminus and purified by proprietary chromatographic techniques.
